

@LeetCode

Given a list of non negative integers, arrange them such that they form the largest number.

Example 1:

Input: [10,2]

Output: "210"

Example 2:

Input: [3,30,34,5,9]

Output: "9534330"

Note: The result may be very large, so you need to return a string instead of an integer.
